IntelliFlow Copilot

Powered by Snowflake Cortex · Llama 3

👋 Hi, I'm your IntelliFlow Copilot, powered by **Grok AI**.

I can:

- Query your Snowflake ticket data (text-to-SQL)
- Trigger workflows from chat
- Answer questions about uploaded documents (RAG)
- Send real emails via your connected Gmail — try: `send email to name@example.com subject Hi message Hello there`

Try one of the suggestions below 📌

1

Data Ingestion

Collect customer support records from Snowflake, CSV or the sample dataset.

2

AI Analysis

The Ticket Analyzer skill reads each record and extracts category, sentiment and urgency.

3

Anomaly Detection

The Risk Detector skill flags unusual patterns and scores each ticket's risk.

4

Decision & Action

The Decision Agent branches on risk level and triggers the right contextual action.

5

Report & Insights

A business report and AI insights are generated automatically at the end of the run.

Built for Real-World Business Operations

The same workflow engine adapts across departments

Ticket Analyzer

Reads customer-support records and produces structured analysis.

Analyze ticket content

Identify issue category

Analyze sentiment

Identify urgency

Summarize ticket

{

"ticket_id": "T1001",

"category": "Payment",

"urgency": "High",

"sentiment": "Negative"

}

⚠️

Anomaly & Risk Detector

Scores each ticket and explains why it was flagged.

Repeated payment failures

Long resolution times

Negative sentiment spikes

Unusual refund amounts

Sudden ticket spikes

{

"anomaly_score": 82,

"risk_level": "Critical",

"reason": "..."

}

🧭

Decision & Action Agent

Applies business rules + AI reasoning to branch and act.

Critical → Escalate + Alert

High → Human review + queue

Medium → Monitor + recommend

Low → Normal processing

IF risk == "Critical":

escalate(); alert();

ELIF risk == "High":

queue("priority");

AI Insights

Generated from the current workflow run

💡

ACCOUNT tickets make up 24% of total volume

Evidence

59 of 250 tickets fall under ACCOUNT

Recommendation

Add a dedicated triage rule for ACCOUNT tickets

Impact

Volume concentration

💡

REFUND issues have the longest average resolution time

Evidence

Average resolution time of 36.9h vs. overall average of 23.2h

Recommendation

Review the REFUND handling workflow for delays

Impact

Process bottleneck

💡

Negative sentiment is highest for REFUND tickets

Evidence

86% of REFUND tickets carry negative sentiment

Recommendation

Prioritize proactive communication on REFUND cases

Impact

Customer experience risk

💡

High-risk tickets are concentrated in ACCOUNT

Evidence

27 of 108 anomalies belong to ACCOUNT

Recommendation

Allocate senior reviewers to ACCOUNT escalations

Impact

Escalation focus

End-to-End Automation Flow

Data → Reasoning → Decision → Action → Report

Each step below links to real, verified proof already shown on this page — no step requires manual data entry once a workflow is triggered.

📂

1. Data Ingest

26,872 real support tickets loaded into INTELLIFLOW_DB.PUBLIC.CUSTOMER_SUPPORT_DATA in Snowflake.

↳ See Data Sources page

🧠

2. Reasoning

Cortex COMPLETE + CoCo CLI analyze ticket text, cluster into categories, and detect distress signals (e.g. "cannot afford" language).

↳ See Cortex Functions panel above

⚖️

3. Decision

Rules/agent logic branch on conditions — e.g. category volume, financial-distress keywords — to decide severity and next action.

↳ See Architecture Diagram above

▶️

4. Action

A Snowflake Task (CATEGORY_REPORT_TASK) is created and executed automatically — verified SUCCEEDED via TASK_HISTORY.

↳ See Workflow Execution panel above

📄

5. Report

Findings, recommendations and metrics are compiled into this report — the same one you're reading now.

↳ This page

▶️

Real Workflow Execution — CATEGORY_REPORT_TASK

End-to-end proof, 2026-07-29

A real Snowflake Task was created via CoCo CLI, executed on demand, and its result verified via TASK_HISTORY — command → execution → output, fully traceable.

TASK_NAME	CATEGORY_REPORT_TASK
STATE	✅ SUCCEEDED
SCHEDULED	2026-07-29 04:13:15 PDT
COMPLETED	2026-07-29 04:13:16 PDT
DURATION	~1.3 seconds
ERROR	None

Run 2 queries

Done. The task `CATEGORY_REPORT_TASK` has been created with no schedule. It's in a `suspended` state by default.

To run it manually:

SQL

`EXECUTE TASK INTELLIFLOW_DB.PUBLIC.CATEGORY_REPORT_T`

Note: since the task body is a `SELECT` (not an `INSERT/MERGE`), it will execute the query but won't persist results anywhere. If you'd like it to write to a table, let me know and I can modify the task body.

Execute task `CATEGORY_REPORT_TASK` now

Execute the `CATEGORY_REPORT_TASK` manually

`EXECUTE TASK INTELLIFLOW_DB.PUBLIC.CATEGORY_REPORT_TASK`

Run this EXECUTE statement?

Skip

Allow

Catalog

M

MRSPLACE

ACCOUNTADMIN

CoCo creates & executes the task via generated SQL (CREATE TASK / EXECUTE TASK)

TASK_HISTORY confirms SUCCEEDED — command → execution → output

Error Handling — Real Test Cases

Verified 2026-07-29

Three real failure scenarios run against this Snowflake account to verify how errors are surfaced and recovered from — not simulated.

1. Invalid table reference

Query against a table that doesn't exist. Snowflake returns a clear SQL compilation error instead of failing silently or returning bad data.

SQL compilation error: Object 'NONEXISTENT_TABLE' does not exist or not authorized.

2. Invalid column — graceful fallback

Snowflake data - CoCo CLI analyzed

Pulled from Snowflake Query History — Monitoring → Query History

Real execution stats for the 8 queries run against this project (2026-07-28/29), all on a single **X-Small** warehouse — no query failed. Sub-second latency at this data size, with the largest scan (5.26MB) still completing in under 300ms.

QUERY	DURATION	BYTES SCANNED	ROWS	WAREHOUSE	STATUS
SELECT COUNT(*) FAILED_WORKFLOWS...	1.6s	—	1	X-Small	✔ Success
SELECT category, intent, ticket_count...	53ms	24.00KB	11	X-Small	✔ Success
SELECT category, intent, count...	61ms	5.23MB	20	X-Small	✔ Success
SELECT category, intent, count...	73ms	64.00KB	27	X-Small	✔ Success
SELECT category, intent, count...	89ms	400.00KB	2	X-Small	✔ Success
SELECT instruction, LEFT(response,200)...	127ms	5.21MB	5	X-Small	✔ Success
SELECT instruction, LEFT(response,250)...	51ms	392.00KB	—	X-Small	✔ Success
SELECT * FROM CUSTOMER_SUPPORT_DATA...	292ms	5.26MB	10	X-Small	✔ Success

IntelliFlow AI analyzed 250 customer support tickets and identified 108 anomalies, of which 0 were Critical and 11 were High risk. The Decision Agent generated 103 contextual actions, requiring no manual triage for standard cases.

- 108 of 250 tickets (43%) were flagged as anomalous.
- 0 tickets require immediate escalation.
- 11 tickets were routed to the priority review queue.

108 anomalies detected across payment failures, delayed resolutions, negative sentiment spikes, unusual refunds, and ticket volume spikes.

QUERY	DURATION	BYTES SCANNED	ROWS	WAREHOUSE	STATUS
SELECT category, intent, ticket_count...	53ms	24.00KB	11	X-Small	✓ Success
SELECT category, intent, count...	61ms	5.23MB	20	X-Small	✓ Success
SELECT category, intent, count...	73ms	64.00KB	27	X-Small	✓ Success
SELECT category, intent, count...	89ms	400.00KB	2	X-Small	✓ Success
SELECT instruction, LEFT(response,200)...	127ms	5.21MB	5	X-Small	✓ Success
SELECT instruction, LEFT(response,250)...	51ms	392.00KB	—	X-Small	✓ Success
SELECT * FROM CUSTOMER_SUPPORT_DATA...	292ms	5.26MB	10	X-Small	✓ Success

Scalability note: warehouse can be resized (X-Small → Small/Medium) if ticket volume grows, without changing any query logic.

EXECUTIVE SUMMARY

IntelliFlow AI analyzed 250 customer support tickets and identified 108 anomalies, of which 0 were Critical and 11 were High risk. The Decision Agent generated 103 contextual actions, requiring no manual triage for standard cases.

KEY FINDINGS

108 of 250 tickets (43%) were flagged as anomalous.

0 tickets require immediate escalation.

11 tickets were routed to the priority review queue.

ANOMALIES DETECTED

108 anomalies detected across payment failures, delayed resolutions, negative sentiment spikes, unusual refunds, and ticket volume spikes.

HIGH-RISK CASES

None in this run

RECOMMENDED ACTIONS

T1005 — Added to monitoring with a generated recommendation

T1006 — Added to monitoring with a generated recommendation

T1009 — Added to monitoring with a generated recommendation

T1011 — Added to monitoring with a generated recommendation

T1012 — Added to monitoring with a generated recommendation

BUSINESS IMPACT

Automated triage removes an estimated 13 hours of manual review per run and surfaces the 11 tickets most likely to affect customer retention.

WORKFLOW PERFORMANCE

Last run processed 250 records with a 100% step-completion rate across Ingestion, Analysis, Detection, Decision, Action and Reporting.

What's implemented today vs. on the roadmap — honestly labeled

✓ = demonstrated live in this project with real Snowflake/CoCo evidence · 🦋 = partially working, described honestly below · 📅 = designed but not yet built. Nothing here is claimed as live unless it's backed by proof elsewhere in this dashboard.

🧭 Autonomous AI Planner

IMPLEMENTED

The Decision & Action Agent picks the next step (escalate, auto-close, flag for review) based on category + risk level, without a human choosing the branch each time.

See Architecture Diagram → Agent Skills, and Report → Decision Branches

🧩 Multi-Agent Collaboration

IMPLEMENTED

Three specialized agents hand off work in sequence: Ticket Analyzer → Anomaly & Risk Detector → Decision & Action Agent.

See Agent Skills page

👤 Human-in-the-loop Approval

IMPLEMENTED

Every state-changing SQL statement CoCo generates (EXECUTE, CREATE, DROP) stops and asks for explicit Allow/Skip before running — verified live in the CoCo session.

See "Allow this EXECUTE statement?" prompts in Report → Workflow Execution & Error Handling screenshots

📁 Long-term Memory

PARTIAL

Every query and task run is permanently logged in Snowflake (QUERY_HISTORY, TASK_HISTORY), so past executions stay queryable indefinitely. Cross-session agent "recall" of past decisions is not yet built.

See Report → Performance Metrics (real query history)

📈 Self-learning Optimization

ROADMAP

Automatically tuning detection thresholds from outcome feedback (e.g. which flagged tickets actually churned) is planned but not yet implemented.

Not yet built

💬 Natural Language Workflow Builder

IMPLEMENTED

Workflows and queries are created by describing them in plain English to CoCo CLI (e.g. "create a task that...") rather than writing SQL by hand.

See Report → Captured CoCo Session Transcript

🔍 Explainable AI

IMPLEMENTED

Every insight ships with a "Key finding" and the reasoning behind it (e.g. which phrases signaled financial distress), not just a raw score

👋

Human-in-the-loop Approval

✓ IMPLEMENTED

Every state-changing SQL statement CoCo generates (EXECUTE, CREATE, DROP) stops and asks for explicit Allow/Skip before running — verified live in the CoCo session.
See "Allow this EXECUTE statement?" prompts in Report → Workflow Execution & Error Handling screenshots

📁

Long-term Memory

🔍 PARTIAL

Every query and task run is permanently logged in Snowflake (QUERY_HISTORY, TASK_HISTORY), so past executions stay queryable indefinitely. Cross-session agent "recall" of past decisions is not yet built.
See Report → Performance Metrics (real query history)

📈

Self-learning Optimization

📅 ROADMAP

Automatically tuning detection thresholds from outcome feedback (e.g. which flagged tickets actually churned) is planned but not yet implemented.
Not yet built

💬

Natural Language Workflow Builder

✓ IMPLEMENTED

Workflows and queries are created by describing them in plain English to CoCo CLI (e.g. "create a task that...") rather than writing SQL by hand.
See Report → Captured CoCo Session Transcript

🔍

Explainable AI

✓ IMPLEMENTED

Every insight ships with a "Key finding" and the reasoning behind it (e.g. which phrases signaled financial distress), not just a raw score.
See Insights page and Report executive summary

🎬

Workflow Simulation

✓ IMPLEMENTED

The Workflow Builder can preview a run step-by-step before it touches real data, so you can sanity-check logic first.
See Workflow Builder page

🔄

Auto Retry & Recovery

🔍 PARTIAL

When a query fails (e.g. wrong column name), the system catches the error and suggests a valid correction automatically. A fully automatic retry loop (no human confirming the fix) is not yet built.
See Report → Error Handling, Case 2

📡

Live Monitoring Dashboard

✓ IMPLEMENTED

Overview and Executions pages reflect real Snowflake activity — ticket counts, anomalies, and task/query status — sourced from actual account data.

Key insight: It's a common frustration signal in financial distress in order cancellations — 33 orders explicitly state "I cannot afford" or "I can no longer afford" the order. These customers are under financial pressure and need immediate empathetic handling.

Recommendations

1. Prioritize ACCOUNT issues — they represent 12% of all tickets across all different intent categories, recovery, registration problems, account deactivation, etc.

2. Flag financial distress cancellations — the 32 "cannot afford" tickets should trigger expedited processing and potentially proactive retention offers.

3. Monitor complaint trends — while currently along with the top 100 most common topics, repeated financial concerns that daily correlate with churn risk.

Showing the category breakdown data in '2026 format file' category: 'ACCOUNT' count: 5966, 'percent': 22.8 [-]

Real-World Relevance

Support teams triage thousands of tickets manually — this automates detection and first response.

Technical Execution

Modular agent skills, explainable anomaly scoring, and true conditional branching — not a single prompt.

Solution Completeness

Ingestion, reasoning, decisioning, action and reporting all run end-to-end in one workflow.

How It Works

Our AI agent follows a multi-step intelligent workflow

- 1 Data Ingestion**
Collect customer support records from Snowflake, CSV or the sample dataset.
- 2 AI Analysis**
The Ticket Analyzer skill reads each record and extracts category, sentiment and urgency.
- 3 Anomaly Detection**
The Risk Detector skill flags unusual patterns and scores each ticket's risk.
- 4 Decision & Action**
The Decision Agent branches on risk level and triggers the right contextual action.
- 5 Report & Insights**
A business report and AI insights are generated automatically at the end of the run.
